ABSTRACT OF THE DISCLOSURE
ENHANCED NETWORKED PRE-PRESS IMAGING

An imaging system includes image processors, storage devices, one or more print drivers, and one or more image makers. The image processors generate image data representing an image. The storage devices store the image data. The print driver(s) generate instructions corresponding to the image data. The image maker(s) generate a representation of the image in accordance with the instructions. A first communications network interconnects the image processors and the print driver(s). A second communications network interconnects the image processors, the print driver(s), and the storage devices.
